GcIde contains a simple, GUI based RAD tool for developing windows application. It is very light, intuitive and easy to learn. More Info : Read more GcIde version 2.1.2 is an open source RAD tool based on the rofrm framework. It is written using ANTLR4 and I have done the parser in C#. It supports Windows Forms,.NETCore and LinuxGTK. Read more GcIde is designed for building GUI applications for Windows, Linux and.NETCore. Moreover, it provides a bridge between ANTLR4 and Windows Forms so developers can write GUI applications using their existing skills. GcIde is a RAD tool built with the rofrm framework, and like its brother RAD tools like qcPro and qcPro Professional: GcIde is built on top of QCPL (Quality Controls Protocol Language), the language used to describe how a form should be constructed by the developer. GcIde aims to become the preferred RAD tool for Windows desktop developers. The syntax of GcIde enables data-driven form development. This is achieved by allowing the developer to define data member by members, especially data binding. What's New: - Check in new WinForms binding logic and WinForms-like templating - GcIde can be compiled as either a Win32 application or a.NET Core application. - Output window now supports Windows application Download now: - Click on the below link to start using GcIde now: more - Subscribe to download version 2.1.2 published: 18 Aug 2017 Best RAD Tool? GcIde is a new IDE based on the GNOME development software. It was born from the idea that a solution to programming should be up to today, a comfortable environment to develop that gives the users a very intuitive feeling. This is made using GNOME as a baseline but small and clean environment. With GNOME we have implemented a lot of tools and features, in this IDE. Features: * Many basic operations are already done for you: creation of form, panels, tabs, custom controls, event handlers. * Now you can create your own custom controls using only the core rfmdriver. * It allows to create prototypes of controls event handlers * It is using rofrm library: (source code is available) * For Windows: GTK, MFC and Win32 ports * For Linux: GTK and Gtk-pixbuf Now the IDE can be customized as it has been designed to be the case, with a lot of GUI tools, which allow you to create a GUI interface. Now there is the possibility to create truly user friendly applications. Now it is possible to create new GUI to edit specific files, or to edit a GUI interface for the users. For example, you can easily create a small sample program, by using a little graphical interface, with a "table", where to put the input and output parameters of your sample program. Using this interface, you can easily drag and drop components. With the help of the IDE you can create the interface, you also have the possibility to connect to the header where the source code is contained. After doing the format, you can compile your program, and then you can execute it. GcIde can be installed on your Linux or Windows system, providing a smooth user experience, with menus, toolbars, form, tabs, custom controls and more. GcIde is a powerful visual component oriented development environment. It allows the user to write and quickly develop applications with an easy interactive development cycle. It support many visual components like: menus, toolbars, treeview, graphview, calendars... Free as a Low Cost Payoff Who wants a low-cost and powerful IDE for Linux with the same features that can be found in $300-500 high-end offerings? I recommend System requirements Basic system requirements Depending on your needs, this IDE might be just enough. It has a performance a little slower than other IDEs, and a touch of overkill in some cases. But for many applications it is not a matter of concern, and you'll be able to develop and debug in no time. A development environment that will run well under Linux is: a modern CPU that supports SSE2 a recent installation of a recent release of the GNU compiler collection a 1 GB RAM a reasonable disk space (on the order of 10-20 GB) A development environment that will run well under Windows is: an Intel Pentium 4 or AMD Athlon processor a recent release of the Windows compiler and a recent release of the Microsoft Visual C++ compiler a reasonable disk space (on the order of 10-20 GB) A development environment that will run well under both Windows and Linux is: an Intel Pentium 4 or AMD Athlon processor a recent release of the GNU compiler collection a modern Windows version of the Microsoft Visual C++ compiler a reasonable disk space (on the order of 10-20 GB) Minimum Software GNU Compiler Collection (GCC) Most of the GNU/Linux distributions come with a fully functional and up to date version of GCC installed. In the case of Ubuntu this is version 4.3.3, so you don't need to update it after installing. Editors XEmacs For many people an IDE is not just an editor, it's an editor plus integrated debugger, enhanced help, and more. The XEmacs IDE is a full featured IDE which supports creating and running programs and debugging them by manipulating control registers. It supports writing C source code, C++ source code, Java source code and has an easy to use GUI for creating and editing HTML and XHTML code. TextMate

What's New in the?

Designed for IDE developers and users, GcIde is a fully-featured IDE for different platforms, including GTK+/GTK# and Win32/Win64. GcIde uses rofrm and the Lazarus IDE API. It offers a new set of features, such as: A scheme view in source code Automatically creates a new form based on a selected file Builds a new form with controls and events on its own, based on a selected scheme Multiple schemes support, such as GTK#, Win32 and Win64 Supports current system's multi-process, multi-thread, and multiple-dispatch paradigms. Demo GcIde can be used by download, execute on your computer and run. By default, it displays the Windows version of the IDE, but can be changed by entering the command line. After running it, you can go to File->Projects list and load your project as with other IDE's. However, there is a big advantage for GcIde is that it has always the "project manager". This, means that you load your project, including new modules, without having to change to any folder, using only the File->New command. Then you can view the implementation of your project and see what is your code. Consider the following sentence. Which preposition applies to the location of the text within the page? And then the next point of interest is that here on the map. I would have said, "the map" since the location of the text is within the map, but the whole point of the sentence is that the text itself is "here". Is that correct? A: The preposition in this case describes the map. "Here" is pointing to the map.
